

Plum/ mirabelle/ gage/ Japanese plum rootstock

Myrobalane

Strong growing rootstock for very dry sites

Vigour: 100%

Lineage: wild form *Prunus cerasifera*

Characteristics: Strong growing rootstock. Especially suitable for high yielding and lesser growing varieties because of its lower fertility. Often used for high-stemmed trees in meadow orchards due to its strong growth rate.

Spacing: 3 - 4 m x 4 - 6 m

Site: High adaptability to dry sites with sandy soils for example. Winter frost damage on the roots is possible when grown in very cold sites.
